

Shubhankar Sharan

Forward-Deployed Product Leader | API Implementations | Enterprise Delivery

[linkedin.com/in/shubsharan](https://www.linkedin.com/in/shubsharan) | github.com/shubsharan | shubhankarsharan@gmail.com | 510-258-2559 | San Francisco

Summary

Forward-deployed product builder and leader with 10+ years of experience turning ambiguous enterprise problems into shipped B2B products, including six years embedded with customers across technical scoping, solution design, implementation, rollout, and expansion. Trusted partner to executives, product leaders, and engineering teams. Combines product judgment and commercial awareness with fluency in APIs, TypeScript, SQL, and Postgres.

Experience

Feb, 2026 - Present

Independent Consulting - Product & Applied AI

- Building applied-AI workflows for clients in private-market investing and healthcare, translating expert processes into agentic products with explicit evaluation criteria, provenance, and human review.
- Kosha Capital Partners: built agents for deal screening and diligence that evaluate companies against investment criteria, traverse deal-room materials, surface missing or contradictory evidence, and generate targeted follow-up questions.
- Recoup Health: built patient health-scoring and care-planning workflows that synthesize longitudinal records, labs, diagnostics, and medical and drug reference material into structured profiles for physician review.

Apr, 2022 - Jan, 2026

Impact Labs - Co-Founder, Head of Product

- Co-founded and led a fintech data platform from customer discovery through production, raising \$1.2M and launching two products across 17 major metros with Stripe, Plaid, and Mercury integrations.
- Owned product and implementation end to end; built the first version hands-on and shipped GenAI workflows that monitored newsletters, social posts, blogs, and real-world events, mapped new information to our impact model, and generated personalized fund updates based on each donor's interests and perspective. Later recruited and directed a distributed engineering team of 10.
- Served as the primary product and technical partner to family offices, investment groups, and nonprofit operators, mapping onboarding, payments, reporting, grant allocation, and data-integration workflows into deployable customer experiences.

2020 - 2022

Regalix - Senior Product Manager, Enterprise Solutions

- Built and scaled a forward-deployed Twilio solutions practice to eight-figure ARR and seven-figure ACV, reducing customer activation time by 30% and increasing 30-day conversion by 20%.
- Owned enterprise engagements end to end, from pre-sales discovery and solution shaping through API implementation, launch, and expansion across communications APIs, routing, automation, reporting, and agent workflows.
- Embedded with customer product and engineering teams to whiteboard user and technical flows, define API and integration requirements, sequence roadmap dependencies, and turn ambiguous enterprise needs into executable delivery plans.

2018 - 2020

Regalix - Forward-Deployed Product Manager

- Increased acquisition by 15% and retention by 27%, generating low-eight-figure business impact for a Fortune 500 global supply-chain organization.
- Turned a loosely defined, multi-million-dollar lifecycle initiative into prioritized workflows, product requirements, implementation milestones, pilots, and automated offerings for complex supply-chain processes.

- Led execution across a 115+ person cross-functional organization spanning executives, operations, product, engineering, and delivery, resolving implementation dependencies and moving successful pilots into scaled production programs.

2016 - 2018

Regalix - Product Designer (later Product Manager)

- First design hire for a B2B sales enablement platform, partnering with enterprise users to map end-to-end workflows and design customer-facing experiences for demonstration authoring, pitch analysis, sales coaching, and representative upskilling.
- Built prototypes and wireframes for early enterprise pilots, translated user feedback into product requirements, established the foundational design system, and moved into product management as the platform scaled.

Selected Work

Keynes - Runtime economics for agents

Developing a runtime and developer SDK that governs how AI agents spend limited resources. Keynes evaluates policy before model or tool use, reserves and reconciles spend in an authoritative ledger, and runs sweeps that show how quality, cost, and latency change under different budgets.

Palimpsest - Semantic team-reasoning puzzle for agents

Designed a collaborative reasoning evaluation in which agents solve a word-substitution cipher from sharded evidence under token, time, and coordination limits. Deterministic grading measures recovery, belief revision, adaptation latency, collaboration gain, and calibration rather than relying on model-as-judge scoring.

Skills

Product & Delivery: Customer discovery, technical scoping, API implementations, user journeys, PRDs, success metrics, roadmap development, project planning, rollout, change management

Technical: REST APIs, webhooks, systems integration, TypeScript, React, Node.js, Go, SQL, Postgres, AI agents, tool orchestration, MCP

Tools: Postman, Figma, Asana, Linear, Jira, GitHub, Sentry, PostHog, Mixpanel, Claude, Codex, Cursor

Education

B.A. Business Management Economics

University of California, Santa Cruz (2013 - 2016)
